Fractal Analysis and Synergetics of Catalysis in Nanosystems Catalysis on nanoparticles is one of the most important sections of nanochemistry. The majority of catalytic systems are nanosystems. At heterogeneous catalysis the active substance is tried to deposit on carrier in nanoparticles form in order to increase their specific surface. Fractal analysis and synergetics of catalysis in nanosystems. They describe fractal models of gas transport processes for polymeric materials, a kinetics of the transesterification of reaction in the presence of mica, the physical fundamentals of transesterification reaction analysis by metals compounds, fractal models of polymerization in the presence of nanofillers, and in appendices.
